Preface xv

Part 1 Classic Analysis

1 Input-Output Characteristics of a Linear Dynamic System: Time Domain 3

1-1 Basic Properties of a Linear Dynamic-System Time Response 4
1-2 The Principle of Linear Superposition 14
1-3 The Convolution Integral of a Linear Time-Invariant System 26
1-4 Relation between the Discrete Pulse-Response Sequence and the Continuous-Impulse Response 33
1-5 The System Step Response 35
1-6 Performance Characteristics of the Step Response 39
1-7 Stability 43
*1-8 Time-Delay and Distributed-Parameter Systems 45
1-9 Linear Time-Varying Systems 48
1-10 Summary 49
Problems 50
Notes and References 50

2 Classic Solution to the Linear Time-Invariant Ordinary Differential Equation Model 54

2-1 Deriving the Differential Equation Model 55
2-2 The Form of the Complete Solution 58
2-3 The Homogeneous Solution 62
2-4 System Stability 65

*An asterisk indicates an advanced topic area that may be omitted from the course of study with no loss in continuity to later material.

2-5	The Particular Solution for Exponential Inputs	66
2-6	The Complete Solution	76
2-7	Elementary Row Operations and the Linear Equation Problem	79
2-8	A Very Subtle Point: The Difference between t_0^- and t_0^+	84
2-9	The System Step Response	88
2-10	The Impulse Response Function	91
2-11	Summary	95
	Problems	96
	Notes and References	100
3	**Input-Output Characteristics of a Linear Dynamic System: Frequency Domain**	101
3-1	Steady-State Response to Sinusoid Inputs	101
3-2	The Bode Magnitude Plot	104
3-3	The Bode Phase-Angle Plot	107
3-4	The Fourier Transform	117
3-5	Properties of the Fourier Transform	121
*3-6	Time-Delay Systems	130
*3-7	Correlation between the System Input and the Steady-State Output	131
*3-8	The Discrete and Fast Fourier Transforms	133
*3-9	Digitally Sampled Signals, Aliasing, and Shannon's Sampling Theorem	134
3-10	Summary	138
	Problems	138
	Notes and References	139
4	**Laplace Transform Analysis**	142
4-1	Definition and Relation to Fourier Transform	142
4-2	Properties of the Laplace Transform	145
4-3	Using the Laplace Transform to Solve the Differential Equation	150
4-4	Unit Step Response Revisited	154
4-5	Interconnection of Linear Systems	158
*4-6	Unity Feedback and the System Poles and Zeros	165
4-7	Summary	166
	Problems	167
	Notes and References	170
5	**The Finite-Difference Equation in Modeling Discrete SISO Systems**	171
5-1	Derivation of the Finite-Difference Equation	172
5-2	The Homogeneous Response	181
5-3	Stability	182
5-4	Relation between the Continuous Poles, p_i, and the Discrete Poles, p_{Ti}	183
5-5	The Particular Solution	188
5-6	Particular Solution to Discrete Sinusoidal Input	193
5-7	The Complete Solution	194

5-8	The z Transform	196
5-9	Properties of the z Transform	198
*5-10	The z Transform Used to Solve the Finite-Difference Equation	201
5-11	Summary	202
	Problems	202
	Notes and References	203

Part 2 State-Variable Analysis

6	**Deriving the State-Variable Model**	209
6-1	Phase-Variable Canonical Form	210
6-2	States Derived via the Simulation Diagram	218
6-3	Diagonal Form, Distinct Roots	223
6-4	Physical-Variable States	226
6-5	Introduction to MIMO State Equations	234
6-6	Summary	237
	Problems	238
	Notes and References	238
7	**State-Space Analysis: Continuous Time**	241
7-1	Simplest Case: First-Order State Model	241
7-2	General State-Space Model	246
7-3	The Resolvent Matrix and e^{At}	247
7-4	Properties of the Matrix Exponential Function	250
7-5	The General-State Solution	255
7-6	Further Consideration of the Fundamental Concept of State	256
7-7	State-Space Solution to Unit Singularity Inputs	258
7-8	Further Consideration of $H(s)$	261
7-9	Summary	264
	Problems	264
	Notes and References	264
8	**State Space Analysis: Discrete Time**	268
8-1	Discrete Time Simulation: First-Order System	268
8-2	Discrete Time Simulation: General MIMO System	273
8-3	Calculation of A_T and B_T	274
8-4	Stability and the Poles of A_T	279
8-5	Relation between the Discrete State Model and the Finite Difference Equation for the SISO System	280
8-6	Calculation of the Discrete Pulse Response from the Discrete State Model	284
8-7	Introduction to Discrete State Controllability	286
8-8	Introduction to Discrete Observability	290
8-9	The System Hankel Matrix Revisited	292
8-10	Summary	293
	Problems	294
	Notes and References	294

9	**Fundamentals of Linear Vector Spaces and Transformation of State Coordinates**	300
9-1	The Definition of a Vector Space	300
9-2	Vector Norms and Inner Products	302
9-3	Linear Combinations of Vectors and Vector Subspaces	305
9-4	Linear Dependence, Independence, and Basis	307
9-5	Transformation of Basis	310
9-6	Transformation of State Coordinates	314
9-7	Use of Controllability and Observability Matrices to Transform State Coordinates	319
9-8	Summary	321
	Problems	322
	Notes and References	322
10	**Eigenvalues, Eigenvectors, and e^{At}**	325
10-1	The Eigenvalue and Eigenvector Linear-Equation Problem	325
10-2	The General Linear-Equation Problem	328
10-3	Elementary Row Operations and the Complete Solution	334
10-4	The Eigenvector Solution	337
10-5	Transforming to the Diagonal and Block-Diagonal Canonical Forms	341
*10-6	The Jordan Canonical Form	345
*10-7	Eigenvalues and Eigenvectors of Real Symmetric Matrices	347
10-8	e^{At} and the Eigenvalues and Eigenvectors	349
10-9	Finding e^{At} Using the Block-Diagonal Form	354
*10-10	Computing e^{At} with the Jordan Canonical Form	356
10-11	e^{At} and the Cayley-Hamilton Theorem	357
10-12	Summary	360
	Problems	360
	Notes and References	361
11	**Controllability and Observability**	367
11-1	Controllability Analyzed via Applying the Cayley-Hamilton Theorem	367
11-2	Observability Analyzed via the Cayley-Hamilton Theorem	372
11-3	Controllability, Observability, and the Transfer Function for the SISO System	375
11-4	Kalman's Canonical Decomposition of State Space	378
11-5	Controllability and Observability Analyzed in Diagonal State Coordinates	380
* 11-6	The Hankel Matrix and Determination of System Model Order	383
* 11-7	Alternative Methods for Calculation of Controllability (Observability)	386
* 11-8	Minimum-Effort Control and Controllability	387
11-9	Summary	392
	Problems	392
	Notes and References	393

12	**Linear Time-Varying State Models**	397
12-1	The General Linear Time-Varying State Model Solution	397
12-2	Properties of the State Transition Matrix	403
*12-3	Controllability of the Linear Time-Varying System	405
*12-4	Observability of the Linear Time-Varying System	406
12-5	Discrete Time Simulation of the Linear Time-Varying System	407
12-6	Linearizing a Nonlinear State Differential Equation	412
12-7	Summary	421
	Problems	422
	Notes and References	424
	Appendixes	425
A	Finding the Transfer Function for a Linear Circuit via Linear Graphs	425
B	Introduction to Matrices	438
C	Partial Fraction Expansions	444
D	Recursive Calculation of the Resolvent Matrix	449
E	Introduction to the Singular Value Decomposition	451
F	Applicable Software	458
G	List of Symbols	461
H	Problem Solutions	464
	Index	477
