1. <i>Image Processing Based on the Linear Theory of Image Formation</i>	
By P.W. Hawkes (With 12 Figures)	1
1.1 Transfer Functions	2
1.2 Transfer Functions with Partially Coherent Illumination	8
1.3 Practical Exploitation of the Linear Relationship	16
1.3.1 Measurement of the Microscope Operating Characteristics	16
1.3.2 On-Line Processing	18
1.3.3 Filtering and Reconstruction	23
References	28
2. <i>Recovery of Specimen Information for Strongly Scattering Objects</i>	
By W.O. Saxton (With 6 Figures)	35
2.1 Image Formation and Interpretation	36
2.1.1 Recapitulation of Coherent Image Formation	36
2.1.2 Interpreting the Specimen Wave	37
2.1.3 Rendering Images Discrete	39
2.2 Methods Iterating the Linear Theory Solution	40
2.3 Methods Requiring No Special Apertures	42
2.3.1 The Data Used	42
2.3.2 The Iterative Transform Algorithm	43
2.3.3 Examples and Practical Applications	45
2.3.4 Uniqueness	46
2.3.5 Periodic Images and Complex Zeros	51
2.3.6 Other Methods of Analysis	52
2.3.7 Conclusions	57
2.4 Methods Using Half-Plane Apertures	58
2.4.1 Hilbert Transforms	58
2.4.2 Logarithmic Hilbert Transforms	59
2.4.3 Real Aperture Shapes	60
2.4.4 Dark-Field Conditions	61
2.5 Analytic Wave Functions and Complex Zeros	62
2.5.1 Zero-Distributions and Zero Flipping	62
2.5.2 An Example	63

2.5.3	Immediate Applications	65
2.5.4	Reformulation of Zero Flipping	68
2.5.5	Two-Dimensional Extensions	69
2.6	Holography	70
2.6.1	The Linear Case	70
2.6.2	The General Case	71
2.6.3	Some Particular Cases	72
2.6.4	Nonplanar Reference Waves	73
2.7	Ptychography and Related Methods	74
2.8	Bright-Field/Dark-Field Subtraction	76
2.9	Other Perspectives	78
2.9.1	Coherence	78
2.9.2	Inelastic Scattering	80
2.9.3	Recording Noise and Radiation Damage	81
2.9.4	Practical Details of Computer Processing	81
2.9.5	Other Constraints	83
2.10	Conclusions	85
	References	85
3.	<i>Computer Reconstruction of Regular Biological Objects</i>	
	By J.E. Mellema (With 24 Figures)	89
3.1	The Biological Object	90
3.1.1	General Remarks	90
3.1.2	Regular Biological Objects	91
3.1.3	Chemical and Physical Processing of the Object	92
3.1.4	Contrast in Bright-Field Images	94
3.1.5	Radiation Damage	95
3.2	Fourier Processing of Electron Micrographs	95
3.2.1	Quantization and Preprocessing	96
3.2.2	The Whittaker-Shannon Sampling Theorem	96
3.2.3	Fourier Transforms of Regular Objects	98
3.2.4	Processing of Two-Dimensional Structures with Translational Symmetry	100
3.2.5	Rotational Filtering	102
3.2.6	Three-Dimensional Reconstruction of Objects with Helical Symmetry	103
3.2.7	Three-Dimensional Reconstruction of Particles with Icosahedral Symmetry	105
3.3	Recent Applications to Image Processing of Regular Biological Structure	107
3.3.1	One-Dimensional Filtering: Tropomyosin Paracrystal Structure	107
3.3.2	The Structure of Polyheads	110

3.3.3	The Structure of Ribosomes	112
3.3.4	The Structure of the Purple Membrane	113
3.3.5	A Correction for Distorted Images	115
3.3.6	Rotational Filtering of Base Plates	118
3.3.7	The Structure of the Contractile Sheath from Bacteriophage Mu	120
3.3.8	The Three-Dimensional Structure of an Icosahedral Virus Particle	123
3.4.	Outlook	125
	References	125
4.	<i>Three-Dimensional Structure Determination by Electron Microscopy (Nonperiodic Specimens)</i> . By W. Hoppe and R. Hegerl (With 23 Figures) ...	127
4.1	History and General Discussion of the Subject	128
4.2	The Fundamental Theoretical Background	133
4.2.1	The Use of a CTEM as a Diffractometer	133
4.2.2	The Description of Structures in Three-Dimensional Electron Microscopy	135
4.2.3	Two-Dimensional Reconstruction (Image Filtering)	137
4.2.4	The Projection Theorem	139
4.3	The Problem of Reconstruction	139
4.3.1	The Whittaker-Shannon-Type Interpolation	140
4.3.2	An Alternative Way of Incorporating the Finite Body Concept	143
4.3.3	Back-Projection and Filtered Back-Projection	144
	a) Simple Back-Projection	144
	b) Filtered Back-Projection	145
	c) The Influence of the Reconstruction Body	147
	d) The Influence of Restricted Tilting Angle	150
4.3.4	Conical Tilting	151
4.3.5	Reconstruction by Series Expansion	154
	a) The Cormack Method	155
	b) Aliasing	159
4.3.6	Algebraic Reconstruction in Direct Space	161
4.3.7	Reconstruction of an "Infinite" Platelet with Restricted Tilting Angle	167
	a) One-Dimensional Whittaker-Shannon Treatment of Single-Axis Tilting	168
	b) Reconstruction by Interpolation in Projection Space	170
	c) The Partially Defined "Unit Cell"	172
4.3.8	Determination of a Common Origin of the Projections	174
4.4	Aspects for the Future	178
4.4.1	The "Atom" Constraint	178
4.4.2	The Use of a STEM as a Diffractometer	179
	References	183

5. <i>The Role of Correlation Techniques in Computer Image Processing</i>	
By J. Frank (With 23 Figures)	187
5.1 Correlation Functions	188
5.1.1 The Cross-Correlation Function	188
5.1.2 The Autocorrelation Function	188
5.1.3 Correlation and Similarity	191
5.2 Computation	192
5.3 Some Important Theorems	195
5.3.1 CCFs of Images Containing Signal and Noise	195
5.3.2 The CCF of Blurred Signals	196
5.3.3 Some Thoughts on Signal, Noise, and Correlation	198
5.4 Determination of Relative Positions	199
5.4.1 Translation	199
5.4.2 Alignment of Projections	202
5.4.3 Centering of a Centrosymmetric Particle	203
5.4.4 Determination of Relative Orientation	204
5.5 Matched Filtering	209
5.6 Characterization of Instrument Conditions	212
5.7 Signal-to-Noise Ratio Measurement	214
5.7.1 Theory	214
5.7.2 Measurement	215
5.7.3 Consequence for Phase Contrast Microscopy	218
5.7.4 Generalized Signal-to-Noise Ratio Measurement	218
5.8 Conclusions	219
References	220
6. <i>Holographic Methods in Electron Microscopy</i>	
By R.H. Wade (With 12 Figures)	223
6.1 Historical Background	223
6.2 Holographic Schemes	225
6.2.1 The Generalized Hologram	225
6.2.2 In-Line Fresnel and Fraunhofer Holograms	227
6.2.3 Sideband Fresnel Holograms	230
6.2.4 Fourier Transform Holograms	231
6.2.5 Single-Sideband Holograms	232
6.2.6 Zone Plate Interpretation	233
6.3 Experimental Electron Holography	236
6.4 Contrast Transfer and Holography	243
6.4.1 In-Line Fresnel Hologram	243
6.4.2 Fresnel Sideband Hologram	245
6.4.3 Single-Sideband Hologram	247
6.4.4 The Effect of Partial Coherence on Resolution	248

6.5	Additional Reading	252
6.6	Conclusions	252
	References	253
7.	<i>Analog Computer Processing of Scanning Transmission Electron Microscope Images.</i> By M. Isaacson, M. Utlaut, and D Kopf (With 14 Figures)	257
7.1	Organization	257
7.2	Characteristics of Analog Processing	258
7.2.1	Grey Scale Modification	258
7.2.2	Filters	260
7.2.3	Signal Mixing	261
7.3	Types of Signals Available in the STEM	262
7.3.1	Basic Signals	262
7.3.2	Detected Signals	264
7.3.3	Extraction of Basic Signals	265
7.3.4	Normalization	267
7.4	Instrumental Characteristics	268
7.4.1	The Analog Processor	268
7.4.2	Display System	270
7.5	Applications	275
7.5.1	Basic Operations	275
7.5.2	Color Conversion Techniques	278
7.6	Conclusion	282
