

# Contents

**Preface** *xiii*

## **1 Introduction** 1

- History 1
- Medical Imaging Modalities 2
- Transmission of Electromagnetic Energy 3
- Imaging with Acoustic Energy 4
- Comparison of X-Rays and Ultrasound 5
- Nuclear Medicine 6

## **2 Linear Systems** 8

- Definition of Linearity 8
- The Superposition Integral, Delta Function, and Impulse Response 9
- Space Invariance 11
- Magnification 11
- Two-Dimensional Fourier Transforms 13
  - Existence Conditions 13

Fourier Transform Relationships	15
Linearity	15
Magnification	15
Shift	15
Convolution	15
Cross Correlation	16
Separability	16
Frequently Occurring Functions and Their Transforms	17
Sampling	18
Elementary Probability	20
Problems	21

### **3 *Physics of Projection Radiography*** 23

Parallel Geometry	23
Attenuation Relationship	24
Source Spectrum	25
The Attenuation Coefficient	27
Analytic Expressions for the Attenuation Coefficient	33
Problems	34

### **4 *Source Considerations in Radiographic Imaging*** 36

Point-Source Geometry	36
Depth-Dependent Magnification	39
Examples of Point-Source Geometry	40
Extended Sources	44
Analysis of Imaging Using Planar Sources	45
Alternate Analysis Using Planar Objects	48
Effects of Source Size	49
Simplifying Relationships Using Solid Objects	49
Nonparallel Source Distributions	53
Effects of Object Motion	56
Representative Source Configurations	58
Problems	59

### **5 *Recorder Resolution Considerations*** 63

Screen-Film Systems	64
Critical-Angle Considerations	69
Energy Spectrum Considerations	70
Alternative Approaches to Recorder Systems	70
Overall System Response	72
Problems	73

**6 Noise Considerations in Radiography and Fluoroscopy 75**

- Resolution Considerations of the SNR 80
- Recorder Statistics 80
- Fluoroscopy 83
- Image Intensifier 84
- Additive Noise 87
- SNR of the Line Integral 88
- Scatter 90
- Scatter Analysis 91
- Scatter Reduction Through Separation 94
- Scatter Reduction Using Grid Structures 96
- Linear Detector Arrays 101
- Problems 102

**7 Tomography 106**

- Motion Tomography 107
  - Circular Motion 110
  - Multiple-Radiography Tomography; Tomosynthesis 111
- Coded Source Tomography 112
- Computerized Tomography 113
- Reconstruction Mathematics—Iterative Approaches 114
- Direct Reconstruction Methods—Fourier Transform Approach 117
- Examples Using Fourier Transform Approach 122
- Alternate Direct Reconstruction—Back Projection 123
- Filtered Back-Projection Reconstruction System 125
- Convolution—Back Projection 127
- Reconstruction of the Attenuation Coefficient 130
- Scanning Modalities 131
- Noise Considerations in Computerized Tomography 138
- Problems 142

**8 Nuclear Medicine 145**

- Scanned Detectors 146
- Imaging Considerations with Gamma-Ray Cameras 147
- Anger Camera 149
- Pinhole Imaging Structures 153
- Parallel Hole Collimator 157
- Noise Considerations 163
- Coded Aperture Systems 164
- Tomographic Source Imaging 166
- Positron Imaging 168
- Problems 170

**11 Selected Topics in Medical Imaging 225**

Nuclear Magnetic Resonance 225

Digital Subtraction Radiography 233

Energy Selective Imaging 235

Novel Data Acquisition and Processing Systems in Three-Dimensional Radiography  
and Ultrasound 240

Line Integral Ultrasonic Reconstruction Systems 240

Direct Acquisition of Radiographic Parameters 242

Stimulated Positron Emission 243
