1	Introduction	1
<i>A Fundamentals</i>		
2	Control with Digital Computers (Process Computers, Microcomputers)	13
3	Fundamentals of Linear Sampled-data Systems (Discrete-time Systems)	17
3.1	Discrete-time Signals	17
3.1.1	Discrete Functions, Difference Equations	17
3.1.2	Impulse Trains	22
3.1.3	Fourier-Transform of the Impulse Train	23
3.2	Laplace-transformation of Discrete-time Functions and Shannon's Sampling Theorem	27
3.2.1	Laplace-transformation	27
3.2.2	Shannon's Sampling Theorem	28
3.2.3	Holding Element	30
3.2.4	Frequency Response of Sampled Systems	32
3.3	z-Transform	33
3.3.1	Introduction of z-Transform	33
3.3.2	z-Transform Theorems	34
3.3.3	Inverse z-Transform	37
3.4	Convolution Sum and z-Transfer Function	40
3.4.1	Convolution Sum	40
3.4.2	Pulse Transfer Function and z-Transfer-Function	41
3.4.3	Properties of the z-Transfer Functions and Difference Equations	45
3.5	Poles and Zeros, Stability	51
3.5.1	Location of Poles in the z-Plane	52
3.5.2	Stability Condition	56
3.5.3	Stability Analysis through Bilinear Transformation	56

3.5.4	Schur-Cohn-Jury Criterion	59
3.5.5	Location of Zeros in the z-Plane	62
3.6	State Variable Representation	64
3.6.1	The Vector Difference Equation Based on Vector Differential Equation	64
3.6.2	The Vector Difference Equation Based on Difference Equation	67
3.6.3	Canonical Forms	71
3.6.4	Processes with Deadtime	74
3.6.5	Solution of Vector Difference Equation	76
3.6.6	Determination of the z-Transfer Function	77
3.6.7	Determination of the Impulse Response	78
3.6.8	Controllability and Observability	78
3.7	Mathematical Models of Processes	82
3.7.1	Basic Types of Technical Processes	82
3.7.2	Determination of the Process Model—Modelling and Identification	84
3.7.3	Calculation of z-Transfer Functions from s-Transfer Functions	85
3.7.4	Simplification of Process Models for Discrete-time Signals	90

B Control-Systems for Deterministic Disturbances

4	Deterministic Control Systems	97
5	Parameter-optimized Controllers	103
5.1	Discretizing the Differential Equations of Continuous PID-Controllers	103
5.2	Parameter-optimized Discrete Control Algorithms of Low-Order	106
5.2.1	Control Algorithms of First and Second Order	108
5.2.2	Control Algorithms with Prescribed Initial Manipulated Variable	115
5.2.3	PID-Control Algorithm through z-Transformation	116
5.3	Modifications to Discrete PID-Control Algorithms	118
5.3.1	Different Evaluation of Control Variable and Reference Variable	118
5.3.2	Different Discretizations of the Derivative Term	120
5.3.3	Delayed Differential Term	120
5.4	Design Through Numerical Parameter Optimization	122
5.4.1	Numerical Parameter Optimization	122
5.4.2	Simulation Results for PID-Control Algorithms	124
5.5	PID-Controller Design Through Pole-Assignment, Compensation and Approximation	138

5.5.1 Pole-assignment Design	138
5.5.2 Design as a Cancellation Controller	140
5.5.3 Design of PID-Controllers Through Approximation of other Controllers	143
5.6 Tuning Rules for Parameter-optimized Control Algorithms	143
5.6.1 Tuning Rules for Modified PID-controllers	144
5.6.2 Tuning Rules Based on Measured Step Functions	144
5.6.3 Tuning Rules with Oscillation Tests	150
5.7 Choice of Sample Time for Parameter-optimized Control Algorithms	151
5.8 Supplementary Functions of Digital PID-Controllers	154
6 General Linear Controllers and Cancellation Controllers.	157
6.1 General Linear Controllers	157
6.1.1 General Linear Controller Design for Specified Poles	158
6.1.2 General Linear Controller Design Through Parameter Optimization	160
6.2 Cancellation Controllers	160
7 Controllers for Finite Settling Time.	166
7.1 Deadbeat Controller Without Prescribed Manipulated Variable	166
7.2 Deadbeat Controller with Prescribed Manipulated Variable.	171
7.3 Choice of the Sample Time for Deadbeat Controllers	176
7.4 Approximation Through PID-Controllers	177
8 State Controller and State Observers	180
8.1 Optimal State Controllers for Initial Values	181
8.2 Optimal State Controllers for External Disturbances	189
8.3 State Controllers with a Given Characteristic Equation.	195
8.4 Modal State Control	196
8.5 State Controllers for Finite Settling Time (Deadbeat).	201
8.6 State Observers	202
8.7 State Controllers with Observers	206
8.7.1 An Observer for Initial Values	206
8.7.2 Observer for External Disturbances	208
8.7.3 Introduction of Integral Action Elements into the State Controller.	215
8.7.4 Measures to Minimize Observer Delays	219
8.8 State Observer of Reduced-Order.	219
8.9 State Variable Reconstruction.	223
8.10 Choice of Weighting Matrices and Sample Time.	225
8.10.1 Weighting Matrices for State Controllers and Observers	226
8.10.2 Choice of the Sample Time	227

9	Controllers for Processes with Large Deadtime	228
9.1	Models for Processes with Deadtime.	228
9.2	Deterministic Controllers for Deadtime Processes	230
9.2.1	Processes with Large Deadtime and Additional Dynamics	230
9.2.2	Pure Deadtime Processes	232
9.3	Comparison of the Control Performance and the Sensitivity of Different Controllers for Deadtime Processes.	235
10	Sensitivity and Robustness with Constant Controllers	242
10.1	On the Sensitivity of Closed-loop Systems	243
10.2	Insensitive Control Systems	246
10.2.1	Insensitivity through Additional Dynamic Feedback . .	247
10.2.2	Insensitivity through Variation of the Design of General Controllers	249
10.3	On the Robustness of Control Systems	253
10.4	Robust Control Systems	258
11	Comparison of Different Controllers for Deterministic Disturbances .	263
11.1	Comparison of Controller Structures, Poles and Zeros	263
11.1.1	General Linear Controller for Specified Poles	264
11.1.2	Low Order Parameter-optimized Controllers.	264
11.1.3	General Cancellation Controller	264
11.1.4	Deadbeat Controller	265
11.1.5	Predictor Controller	266
11.1.6	State Controller	267
11.2	Characteristic Values for Performance Comparison	270
11.3	Comparison of the Performance of the Control Algorithms . .	272
11.4	Comparison of the Dynamic Control Factor	283
11.5	Conclusions for the Application of Control Algorithms.	288
 Appendix A		
A1	Tables of z-Transforms and Laplace-Transforms	291
A2	Table of Some Transfer Elements with Continuous and Sampled Systems	292
A3	Test Processes for Simulation	292
A4	On the Differentiation of Vectors and Matrices	301
 Appendix B.		
Problems		301
 Appendix C.		
Results of the Problems.		310
