C Control Systems for Stochastic Disturbances

12 Stochastic Control Systems (Introduction)	3
12.1 Preliminary Remarks	3
12.2 Mathematical Models of Stochastic Signal Processes	3
12.2.1 Basic Terms.	4
12.2.2 Markov Signal Processes	6
12.2.3 Scalar Stochastic Difference Equations.	8
13 Parameter-optimized Controllers for Stochastic Disturbances	10
14 Minimum Variance Controllers for Stochastic Disturbances	13
14.1 Generalized Minimum Variance Controllers for Processes without Deadtime	13
14.2 Generalized Minimum Variance Controllers for Processes with Deadtime	21
14.3 Minimum Variance Controllers for Processes with Pure Deadtime	25
14.4 Minimum Variance Controllers without Offset	27
14.4.1 Additional Integral Acting Term	27
14.4.2 Minimization of the Control Error	28
14.5 Simulation Results with Minimum Variance Controllers	28
14.6 Comparison of Various Deterministic and Stochastic Controllers	32
15 State Controllers for Stochastic Disturbances	36
15.1 Optimal State Controllers for White Noise	36
15.2 Optimal State Controllers with State Estimation for White Noise.	38
15.3 Optimal State Controllers with State Estimation for External Disturbances	40

D Interconnected Control Systems

16 Cascade Control Systems 49

17 Feedforward Control 56

 17.1 Cancellation Feedforward Control 56

 17.2 Parameter-optimized Feedforward Control 60

 17.2.1 Parameter-optimized Feedforward Control without a Prescribed Initial Manipulated Variable 60

 17.2.2 Parameter-optimized Feedforward Control with Prescribed Initial Manipulated Variable. 61

 17.2.3 Cooperation of Feedforward and Feedback Control. 64

 17.3 State Variable Feedforward Control 65

 17.4 Minimum Variance Feedforward Control 66

E Multivariable Control Systems

18 Structures of Multivariable Processes 71

 18.1 Structural Properties of Transfer Function Representations. 71

 18.1.1 Canonical Structures 71

 18.1.2 The Characteristic Equation and Coupling Factor. 75

 18.1.3 The Influence of External Signals 78

 18.1.4 Mutual Action of the Main Controllers 79

 18.1.5 The Matrix Polynomial Representation 82

 18.2 Structural Properties of the State Representation. 82

19 Parameter-optimized Multivariable Control Systems 89

 19.1 Parameter Optimization of Main Controllers without Coupling Controllers 89

 19.1.1 Stability Regions. 92

 19.1.2 Optimization of the Controller Parameters and Tuning Rules for Twovariable Controllers 96

 19.2 Decoupling by Coupling Controllers (Non-interaction) 99

 19.3 Parameter Optimization of the Main and Coupling Controller . . 103

20 Multivariable Matrix Polynomial Control Systems 105

 20.1 The General Matrix Polynomial Controller 105

 20.2 The Matrix Polynomial Deadbeat Controller 105

 20.3 Matrix Polynomial Minimum Variance Controllers 107

21 Multivariable State Control Systems. 109

 21.1 Multivariable State Control Systems 109

 21.2 Multivariable Matrix Riccati State Controllers 112

21.3	Multivariable Decoupling State Controllers	113
21.4	Multivariable Minimum Variance State Controllers	113
22	State Estimation	116
22.1	Vector Signal Processes and Assumptions	117
22.2	Weighted Averaging of Two Measurements	119
22.3	Recursive Estimation of Vector States (Kalman Filter)	121
<i>F</i>	<i>Adaptive Control Systems</i>	
23	Adaptive Control Systems (A Short Review)	127
23.1	Model Reference Adaptive Systems (MRAS).	129
23.1.1	Local Parameter Optimization	130
23.1.2	Ljapunov Design.	132
23.1.3	Hyperstability Design	133
23.2	Adaptive Controllers with Identification Model (MIAS).	138
24	On-line Identification of Dynamical Processes and Stochastic Signals.	141
24.1	Process and Signal Models	141
24.2	The Recursive Least Squares Method (RLS).	143
24.2.1	Dynamical Processes	143
24.2.2	Stochastic Signals	148
24.3	The Recursive Extended Least Squares Method (RELS).	149
24.4	The Recursive Instrumental Variables Method (RIV)	150
24.5	A Unified Recursive Parameter Estimation Algorithm.	152
24.6	Modifications to Recursive Parameter Estimation Algorithms	154
25	On-line Identification in Closed Loop	158
25.1	Parameter Estimation with Perturbations	159
25.1.1	Indirect Process Identification	160
25.1.2	Direct Process Identification	164
25.2	Parameter Estimation with Perturbations	167
25.3	Methods for Closed Loop Parameter Estimation.	168
25.3.1	Indirect Process Identification without Perturbation	169
25.3.2	Direct Process Identification without Perturbation	169
25.3.3	Direct Process Identification with Perturbation	169
26	Parameter-adaptive Controllers.	170
26.1	Design Principles	170
26.2	Suitable Control Algorithms	175
26.2.1	Deadbeat Control Algorithms	175
26.2.2	Minimum Variance Controllers	176

26.2.3	Parameter-optimized Controllers.	179
26.2.4	General Linear Controller with Pole-assignment (LCPA)	179
26.2.5	State Controller.	179
26.3	Suitable Combinations.	180
26.3.1	Ways of Combinations	180
26.3.2	Stability and Convergence	182
26.3.3	Choice of the Elements for Parameter-adaptive Controllers.	185
26.4	Stochastic Parameter-adaptive Controllers	188
26.4.1	Adaptive Minimum Variance Controller (RLS/MV4)	188
26.4.2	Adaptive Generalized Minimum Variance Controllers (RLS/MV3, RELS/MV3)	190
26.5	Deterministic Parameter-adaptive Controllers	192
26.5.1	Adaptive Deadbeat Controller (RLS/DB)	193
26.5.2	Adaptive State Controller (RLS/SC).	196
26.3.3	Adaptive PID-Controllers.	199
26.6	Simulation examples	207
26.6.1	Stochastic and Deterministic Adaptive Controllers	207
26.6.2	Various Processes	208
26.7	Start of Parameter-adaptive Controllers and Choice of Free Design Parameters	208
26.7.1	Preidentification	212
26.7.2	Choice of Design Parameters.	212
26.7.3	Starting Methods.	213
26.8	Supervision and Coordination of Adaptive Controllers.	215
26.8.1	Supervision of Adaptive Controllers.	215
26.8.2	Coordination of Adaptive Controllers.	217
26.9	Parameter-adaptive Feedforward Control	217
26.10	Parameter-adaptive Multivariable Controllers	220
26.11	Application of Parameter-adaptive Control Algorithms	221
