

Contents

1. SECOND-ORDER DIFFERENTIAL EQUATIONS IN THE PHASE PLANE	1
1.1. Phase diagram for the pendulum equation	1
1.2. Autonomous equations in the phase plane	5
1.3. Conservative systems	10
1.4. The damped linear oscillator	12
1.5. Nonlinear damping	16
1.6. Some applications	20
1.7. Parameter-dependent conservative systems	25
Exercises	29
2. FIRST-ORDER SYSTEMS IN TWO VARIABLES AND LINEARIZATION	36
2.1. The general phase plane	36
2.2. Some population models	39
2.3. Linear approximation at equilibrium points	43
2.4. The general solution of a linear system	44
2.5. Classifying equilibrium points	45
2.6. Constructing a phase diagram	51
2.7. Transitions between types of equilibrium point	53
Exercises	54
3. GEOMETRICAL AND COMPUTATIONAL ASPECTS OF THE PHASE DIAGRAM	65
3.1. The index of a point	65
3.2. The index at infinity	74
3.3. The phase diagram at infinity	76
3.4. Limit cycles and other closed paths	81
3.5. Computation of the phase diagram	84
Exercises	88
4. AVERAGING METHODS	98
4.1. An energy-balance method for limit cycles	98
4.2. Amplitude and frequency estimates	102
4.3. Slowly-varying amplitude: nearly periodic solutions	105
4.4. Periodic solutions: harmonic balance	109
4.5. The equivalent linear equation by harmonic balance	110
Exercises	113
5. PERTURBATION METHODS	120
5.1. Outline of the direct method	120

5.2.	Forced oscillations far from resonance	122
5.3.	Forced oscillations near resonance with weak excitation	123
5.4.	The amplitude equation for the undamped pendulum	126
5.5.	The amplitude equation for a damped pendulum	129
5.6.	Soft and hard springs	130
5.7.	Amplitude-phase perturbation for the pendulum equation	134
5.8.	Periodic solutions of autonomous equations (Lindstedt's method)	136
5.9.	Forced oscillation of a self-excited equation	138
5.10.	The perturbation method and Fourier series	140
	Exercises	142
6.	SINGULAR PERTURBATION METHODS	146
6.1.	Non-uniform approximations to functions on an interval	146
6.2.	Coordinate perturbation (renormalization)	148
6.3.	Lighthill's method	153
6.4.	Multiple time scales (two-timing)	155
6.5.	Matching approximations on an interval	160
6.6.	A matching technique for differential equations	165
	Exercises	168
7.	FORCED OSCILLATIONS: HARMONIC AND SUB-HARMONIC RESPONSE, STABILITY, ENTRAINMENT	174
7.1.	General forced periodic solutions	174
7.2.	Harmonic solutions, transients, and stability for Duffing's equation	176
7.3.	The jump phenomenon	183
7.4.	Harmonic oscillations, stability, and transients for the forced van der Pol equation	186
7.5.	Frequency entrainment for the van der Pol equation	191
7.6.	Comparison of the theory with computations	194
7.7.	Subharmonics of Duffing's equation by perturbation	195
7.8.	Stability and transients for subharmonics of Duffing's equation	200
	Exercises	205
8.	STABILITY	212
8.1.	Poincaré stability (stability of paths)	213
8.2.	Paths and solution curves	218
8.3.	Liapunov stability (stability of solutions)	221
8.4.	Stability of linear systems	225

8.5. Structure of the solutions of n -dimensional linear systems	227
8.6. Stability and boundedness for linear systems	234
8.7. Stability of systems with constant coefficients	235
Exercises	239
9. DETERMINATION OF STABILITY BY SOLUTION PERTURBATION	243
9.1. The stability of forced oscillations by solution perturbation	243
9.2. Equations with periodic coefficients (Floquet theory)	245
9.3. Mathieu's equation arising from a Duffing equation	251
9.4. Transition curves for Mathieu's equation by perturbation	256
9.5. Mathieu's damped equation arising from a Duffing equation	257
Exercises	261
10. LIAPUNOV METHODS FOR DETERMINING STABILITY	267
10.1. Liapunov's direct method	267
10.2. Liapunov functions	268
10.3. A test for instability	272
10.4. Stability and the linear approximation in two dimensions	273
10.5. Special systems	281
Exercises	285
11. THE EXISTENCE OF PERIODIC SOLUTIONS	293
11.1. The Poincaré–Bendixson theorem	293
11.2. A theorem on the existence of a centre	301
11.3. A theorem on the existence of a limit cycle	305
11.4. Van der Pol's equation with large parameter	311
Exercises	314
12. BIFURCATIONS, STRUCTURAL STABILITY, AND CHAOS	317
12.1. Examples of bifurcations	317
12.2. The fold and the cusp	319
12.3. Structural stability and bifurcations	323
12.4. Hopf bifurcations	327
12.5. Poincaré maps	329
12.6. Chaos and strange attractors	336
12.7. Perturbation analysis of an amplitude bifurcation	345
12.8. Homoclinic bifurcation	347
Exercises	357
APPENDIX A: Existence and uniqueness theorems	362
APPENDIX B: Hints and answers to the exercises	365
BIBLIOGRAPHY	373
INDEX	377
