

Metals for biomedical devices

Edited by M Niinomi,

ISBN-13: 978 1 84569 434 0

Contents

PART 1 GENERAL INTRODUCTION

Overview of metals and biomedical applications

T Hanawa, Tokyo Medical and Dental University, Japan

- Introduction
- General properties required for metals in medical devices
- Stainless steels
- Cobalt-chromium-based alloys
- Titanium-based alloys
- Shape memory and superelastic alloys
- Noble metals and alloys
- Other metals
- References

Metal selection for biomedical devices

Y Okazaki, National Institute of Advanced Industrial Science and Technology, Japan

- Introduction
- Standardised implantable metals
- Biocompatibility of various metals
- Highly biocompatible $\alpha+\beta$ -type Ti alloy
- Stability of passive film formed on metals
- Metal ion release
- Evaluation of biological property
- Fatigue assessment
- Orthopaedic implant device failure: adverse analysis of clinical cases
- Performance evaluation for orthopaedic devices
- Future trends
- References

PART 2 MECHANICAL BEHAVIOUR, DEGRADATION AND TESTING OF METALS FOR BIOMEDICAL DEVICES

Mechanical properties of metallic biomaterials

T Nakano, Osaka University, Japan

- Introduction
- Requirements for in vivo mechanical functions
- Methods for strengthening metallic biomaterials
- Phase rule and phase diagram
- Deformation and recovery, recrystallization, and grain ripening
- Microstructure and related mechanical properties in typical metallic biomaterials
- Development of metallic biomaterials based on biological bone tissues
- Summary
- References

Corrosion of metallic biomaterials

S Hiromoto, National Institute for Materials Science, Japan

- Importance of corrosion
- Principle of corrosion
- Corrosion morphology
- Evaluation methods of corrosion behaviour
- Biological environments
- References

Fatigue and failure of metallic biomaterials

M Niinomi, Tohoku University, Japan

- Introduction
- Fatigue strength

- Fatigue crack propagation
- Fretting fatigue strength in air and in vitro
- Fatigue strength of wire
- Summary
- References

Mechanical testing of metallic biomaterials

N Maruyama, National Institute for Materials Science, Japan

- Fracture of metal implants and test methods
- Living body environment
- Tensile strength of metallic materials
- Fatigue and fretting fatigue of metallic materials
- Effect of corrosion on fatigue and fretting fatigue
- Corrosion fatigue and fretting corrosion fatigue tests in a simulated body environment
- Results of fatigue and fretting fatigue tests of metallic biomaterials
- New fatigue test for metallic biomaterials
- Acknowledgements
- References

Wear testing of metallic biomaterials

Y Yan, University of Leeds, UK

- Introduction of tribology-related testing
- General testing methods for tribological properties
- Tribo-corrosion testing
- Surface analysis for tribology and tribocorrosion properties
- Future trends
- References

Biocompatibility of metallic biomaterials

C Cui, Hebei University of Technology, China

- Introduction
- Titanium and its alloys
- Biomedical applications and development of Ti and its alloys
- Biocompatibility and fabrication of in situ synthesized bioceramic coating on Ti alloys
- Acknowledgements
- References

PART 3 PROCESSING METALS FOR BIOMEDICAL APPLICATIONS

Forging metals and alloys for biomedical applications

M Chandrasekaran, Bio-scaffold International Pte Ltd, Singapore

- Introduction
- Fundamentals of forging and typical forging process applied to metals and alloys for biomedical applications
- Properties for forgeability
- Microstructural development and its consequences on properties
- Forging of metals and alloys for biomedical applications
- Die materials and die design for forging
- Powder metallurgy forging of metals and alloys for biomedical applications
- Summary
- Sources of further information and advice

Surface treatment of metallic biomaterials

R Thull, University of Wuerzburg, Germany

- Introduction
- Surface structuring
- Physical modifications
- Strength of modification
- Interface modulation and biocompatibility
- Future developments and optimizations
- Summary
- Sources of further information and advice
- References

Coatings for metallic biomaterials

T Kasuga, Nagoya Institute of Technology, Japan

- Introduction
- Calcium phosphate ceramic coatings
- Calcium phosphate glass-ceramic coatings
- Bioactive surface prepared by chemical treatments
- Conclusion
- References

Biocompatible polymer assembly on metal surfaces

K Ishihara and J Choi, The University of Tokyo, Japan

- Introduction
- Phospholipid polymers provided biocompatible surfaces on metal
- Surface grafting of the 2-methacryloyloxyethyl phosphorylcholine (MPC) polymer on titanium alloy
- MPC polymer assembly on Ti alloy
- Future trends
- Summary
- Acknowledgment
- References

Sterilisation and cleaning of metallic biomaterials

S Lerouge, Ecole de technologie supérieure, Canada

- Introduction
- Concepts and definitions
- Principal methods of sterilisation of biomaterials, advantages and limits
- Alternative sterilisation methods
- New challenges for sterilisation
- Cleaning
- Standards and other sources of further information
- Summary
- References

PART 4 SPECIFIC APPLICATIONS OF METALS FOR BIOMEDICAL DEVICES

Orthopaedic applications of metallic biomaterials

T Matsushita, Chubu University, Japan

- Introduction
- Total hip replacement
- Total knee replacement
- Miscellaneous joint replacement
- Implants for bone fracture
- Failure of orthopaedic implants
- Summary
- References

New generation metallic biomaterials

T Narushima, Tohoku University, Japan

- Introduction
- Brief overview of traditional metallic biomaterials
- Newer alloys as metallic biomaterials
- Novel processing technologies for metallic biomaterials
- Other metallic biomaterials
- Future trends
- Sources of further information and advice
- References

Degradable metallic biomaterials for cardiovascular applications

H Hermawan, D Dubé and D Mantovani, Laval University, Canada

- Introduction
- Clinical needs for using degradable metallic biomaterials
- Studies on degradable metallic biomaterials for cardiovascular applications
- Lessons from the first ten years of investigation in degradable metallic biomaterials
- References
