Chapter 1 **Physiological Regulation and Control**

J. H. Milsum and F. A. Roberge

I. Introduction	1
II. Mathematical Formulation of Systems	4
A. Some General Definitions	4
B. Assumptions	7
C. Description of Linear Systems	9
D. State Vector and State Equations	11
E. The Transfer Function and Its Properties	14
F. Vector Representation of Transfer Functions	15
G. Example: Electrical Phenomena across Excitable Membranes	18
III. Control Theory	20
A. Structure and Dynamics of Control Systems	21
B. Structure of Physiological Control	34
IV. Stability and Oscillations	40
A. Stability	40
B. Oscillations and Stability in Physiological Systems	58
V. Optimization	63
A. An Evolutionary Basis for Design and Operating Optimization	63

	B. Hierarchical Aspects	65
	C. Performance Indices, Cost Functions	68
	D. Analytical Trade-Off and Optimality Conditions	72
	E. The Respiratory-Cardiovascular System	74
	References	93
Chapter 2A	Mathematical Aspects of Some Cardiovascular Phenomena	
	<i>N. Rashevsky</i>	
	I. Introduction and Scope	97
	II. Linear Case	101
	III. Some Applications of the Linear Case: A Two-Chamber Theory	111
	IV. Nonlinear Case	115
	V. Applications of the Nonlinear Theory	120
	VI. Volume Elasticity and the Elasticity of the Blood Vessel Wall: Propagation of Pulse Waves	128
	References	138
Chapter 2B	The Principle of Adequate Design	
	<i>N. Rashevsky</i>	
	I. Models and General Principles in Biology	143
	II. Quantitative Description of a Form of an Organism	147
	III. Form of Plants	148
	IV. An Example of the Application to the External Shape of a Quadruped	154
	V. Application to the Size of the Aorta	157
	VI. Overall Design of the Circulatory System: Peripheral Resistance	158
	VII. The Overall Design of the Cardiovascular System and the Evaluation of Its Basic Parameters	167
	References	174
Chapter 2C	A Unified Approach to Physics, Biology, and Sociology	177
	<i>N. Rashevsky</i>	
Chapter 3	Automata Theory in the Context of Theoretical Neurophysiology	
	<i>Michael A. Arbib</i>	
	I. The Concept of State	193
	II. Finite-State Models of Neural Nets	203

III. Complexity Theory for Pattern Recognition Networks	212
IV. An Aside: Gödel's Incompleteness Theorem	228
V. From External to Internal Descriptions	239
VI. The Correction of Errors in Communication and Computation	251
A. Reliable Brains from Unreliable Neurons	251
B. Von Neumann's Multiplexing Scheme	254
C. Shannon's Communication Theory	256
D. Communication Theory and Automata	270
E. The Cowan-Winograd Theory of Reliable Automata	273
References	280

Chapter 4 The Deterministic Theory of Population Dynamics

Aldo Rescigno and I. W. Richardson

I. Introduction	283
II. The Dynamics of an Isolated Species	286
A. Malthus' Equation	286
B. The Pearl-Verhulst Equation	286
C. A General Logistics Growth Rate Function	287
III. The Modes of Interaction between Two Species	288
A. Competition and Volterra's Competitive Exclusion Principle: Two Species Competing for a Common Ecological Niche	288
B. Two Species Living in a Predator-Prey Relationship	289
C. Symbiosis	304
D. Parasitism	312
E. A General Qualitative Theory for the Interactions between Two Species	316
IV. The Interactions between Three or More Species	325
A. Competition Involving Several Species	325
B. Predation Involving Several Species	336
V. Incorporation of "Historical Actions"	346
A. The System Equations for Predation	346
B. Law of Conservation of the Means and Law of Perturbation of the Means for "Historical Actions"	352
VI. Epilogue	358
References	359

Chapter 5 Is There a Unified Mathematical Biology? 361

Robert Rosen
